## Overview

## July 1982 Petroleum Supply Summary

In July 1982 cyude oil' and natural gas liquids plant production avaraged 10.2 million barrels per day, up slightly from the 10.0 million barrals per day during the same pariod in 1981. During July, 1982, petroleum products supplied (a proxy for consumption) averaged 14.8 million barrels per day, down 5.8 percent from the 15.7 million barrals daily average for July of 1981, Refinery inputs of crude oil for July 1982 averaged 12.4 million barrals per day, a 1.5 percent increase over the previous July. Daily operable crude oil distillation copacity in July 1982 averaged 17.1 million barrels daily, compared with 18.7 million berrola daily a year earlier. The refinery utilization rate was 75.2 percent in July 1982, compared with 67.4 percent one year sarlier. Total petroleum at Imports in July 1982, were de-5.0 million berreis per day, and the yearcet one day, compared with 5.6 million berreis per day for the first 7 months in 1981. Petroleum product atocks at the earlier levels, 782 million barrels compared with 880 million barrels. July 1982 residual fuel oil stocks ware 10 milser and 1982 million barrels comsistent and the second of the second of the earlier levels, 782 million barrels comsistent and the second of the second of the earlier; and inventorless of total motor genetics at the end of July 1982 were million barrels before the July 1982 were million barrels before the July 1983 formillion barrels before the July 1983 for-

'Including lease condensate.

## Update

### Refinery Shutdowns During 1982

The June issue of the Petroleum Supply Monthly highlighted refinery activities in 1981. It indicated that between January 1, 1981 and January 1, 1982, twenty-three refineries having a combined capacity greater than 450,000 barrele par day, were permanently shut-

At the beginning of 1982, operable refinery capacity totalled 17.9 million barrule per day. A portion of this operable capacity (1.8 million barrule per day was fills but capable of rectarting within 90 days. During 1982, the pace of permanent buttoforms has quickimed (see "Tabla I below). In particular, for the Juns and July report principed, 37 refineries, having a combined capacity of \$81,000 having a combined capacity of \$81,000 having a combined capacity of \$10,000 having the shadown to total permanent shut-downs for the year is now at 44 rebuttofown. This lots permanent shut-downs for the year is now at 44 rebuttofown. This lots is now at 45 rebuttofown to the permanent shut-downs for the year is indicate that by the end of 1982 it is now peried that \$27 refineries having a combined quantity of 1.2 million barreleps and day will have been permanently shut-

## Petroleum Focus

## Distillate Fuel Oil Outlook: Winter 1982-83

As the winter 1982-26 besting easons approaches attention turns to the adqueer of heating oil stocks. A besic corn is whether supplies of heating oil this winter will be sufficient to meet U.S. denand. A second concern is whether low inventories of heating oil this winter will be sufficient to most window of the control of the control

Preliminary data indicate that the level of entirinated inventories should be a dequate, but that the cushion of extra inventories is smaller than in previous years. However, since current inventories of crude oil are relatively high in terms of days of supply, and refineries are producing well below their maximum capacity, potential supplies are expected to be sufficient to meet even the extra demands of colder weather and stronger economic growth. Supplies of heating oil should be adequate, unless there is some drastic reduction in the worldwide availability of crude oil or in ers to produce heating oil

If demand is higher than expected during the winter heating seeson and stock levels fall more rapidly then expected, industry can edjust by:

- Drawing down crude oil stecks and increasing the rate of refinery utilization. Crude oil stocks at the action. Crude oil stocks at the act of August were 356 MMB, well within the average range for this time of year. Refinery utilization of 68 percent during the first 8 months of 1982 is well below rechilation of the second process which have been a high as 88 percent in 1975.
- Importing more distillate from outside the United States. Current distillate imports are well below the peak of more then 650 MB/D in February 1977. Presently, Europe has more excess refining capacity than the United States.
- Changing present refinery yields to produce more distillate.

These options provide industry with considerable flexibility to respond to increase in demend

#### Recent Trends in Fuel Oil

This article reviews recent trends in the demand for and supply of distillate and regidual fuel oils, the two principal netroleum producte used for heating in the United States. The uses of these petroleum producte have changed significantly since 1977, the year of peak consumption. In that year, less than 40 percent of all distillate was consumed by the transportation sector (e.g., automobiles, vessels, and railroads), whereas by 1981 more than half of all distillete supplied was consumed for transportation, reflecting decreased heating use. Although one of the principal uses of distillate has been onere heating less than one gallon in five (19 percent) of all distillate supplied in 1981 was used for residential heating.

### Recent Trends in Demand

Demand for distillate fuel oil peaked in 1978 at about 3.4 million barreis per day and full to about 2.8 million barreis per day by 1961 (see Table 1). This decrease of choo; IT percent in three years can be attributed to thempse in variables at factoristic to the control of the control to the control of the control of the control to the control of the control of the control to the control of the control of the control of the contextual medicals, exceeding the control of the linearist variable over the 1976 1981 inriod was price. In real terms, residential heating oil prices rose more than 75 percent over the 1978-1981 period—en annual average incress of over 20 percent.

Price incresses can affect quantities de manded in soveral ways:

- Utilization of fuel-burning equipment decreeses as consumers and husinesses "do without." This is typically a very short-term reangues.
- Existing equipment is run using alternative, less costly fuels. This is also typically a short-term response, and generally applies only to those astablishments which have invested in dual-fired boilers and function.
- Embodied and disembodied technological changes are made to average and the string equipment or the environment in which it is used. An exemple of an embodied change is eleming and adjusting furnases and boilers to make them more efficient. An example of a disembodied change is adding more insulation to a home or office building.

Table 1. Distillate Fuel Oil Supply and Demand: 1978-1982 (Million Barrels per Day)

Year/ Quarter	Product Supplied (Apparent Demand)	Production	Net Importat	Stock Withdrawale

Exhibit 1. Deliveries of Distillate Fuel Oil by Use as Percent of Total (Millions of Barrels)

Source: EIA, Petroleum Supply Annual 1981 \*These were a single category prior to 1979.

These changes typically take place over a longer period of time and have a more lasting impact.

 Purchase and installation of naw, more efficient fuel-burning equipment. Because of the cost involved, this is typically a longterm invastment decision. Once the investment has been made, its impact will be felt for many years.

A Rasidential Energy Consumption Survey conducted by the Brasey Information Administration (EIA) in 1890 and 1981 indicated that during the April 1975-March 1980 period, on estimated 13 million households, or 8.2 percent of all households than heating with fuel oil or lecrosens, whiched to other fuels, mainly wood and natural gas, as their mate aware of heat. In addition, during 1978-1979, approximately 1.9 million householde heating with fuel oil or kerosons added attic insulation; 1.6 million added atorm windows and/or storm doors; and 0.7 million added well insulation. These data indicate a significant trend towerd both fuel-witching and conservation by residential consumers of fuel dil.

Consumption of distillate fuel oil is shifting from the traditional fuel oil use for space heating, industrial purposse, and electricity generation toward increased usage in the transportation sec-

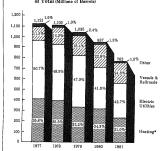

Energy Information Administration, Deperiment of Energy, Residential Energy Consumption Survey: Report Numbers: DOE/EIA-0207/6, July 1980; DOE/ EIA-0222/1, April 1981; DOE/EIA-0314\_June 1982. tor (see Exhibit 1). On-highway diseal had the most dramatic increase, 28 percent from 1977 to 1981, while selection utility use declined 76 percent during the same period. In 1981, disect fuel accounted for over 50 percent of the disection of the commentation of the disection of the private and commentation. This reflects both the increases in the diseal ponetration of the private and commercial automobile fised, and the overall decline in demand over the 1978-81 nextlement.

The latest demande (through mid-1982) show en apparent leveling off of the deline in consumption noted earlier. Pailing prices and anticipation of price increases contributed to a slight increase social through the second quarter of 1982. Despite a three of the price increase in the second quarter of 1982. Despite a condect-them-normal writer, first quarter demand in 1982 was down 9 percent from year-earlier levels, largely because

of lower first-quarter seonomic activity.
Another factor in the leveling off of the distillate demand decrease is the likelihood that consumer actions woth as adding insulation, retrofitsing, and doing without have already been completed, and that further efficiencies will occur more slowly as the current oteck of fuel-burning equipment is replaced over the next several years.

Exhibit 2 indicates changes in the composition of residual fuel oil consumption. The commercial, industrial, and oil company sectors together declinal, and oil company sectors together declinal of the company sectors together declinal to the consumption by the transportation sector in 1981 accounted for about 22 percent of total demand. Consumption by electric utilities declined 570,000 berrels per day, or almost 40 percent, butween 1918 and 1981

0.5

(Exhibit 3). Utility companies shifted from electricity generation using petro- issum to generation using other energy sources. While electricity generation in-

tom to generally generation using percotion to general sets using other energy sources. While sets using other energy sources. While protect in 10% and 10%1, generation using energial of a clined 44 percent. Coal and natural source than made by the deline attempt generation by natural ges etopped generation by natural ges etopped growing in 1981, while growth is electricity generation using only continued to be strong.

The greatost domand levels for residual fael oil were about 3.0 million barrais pur day in 1977 and in 1978. By 1861 (see Table 2), demand had dropped to about 2.09 million barrais per day, a decrease of about 2.0 present in 5 years. A major determinant in the decline was price, which nearly doubled in real terms over the 3-vers peried. 1979 about 2.00 million to the second of the control of the second of

### Recent Trends in Supply

Production, net imports, and net stock withdrawala comprise the supply of distillate fuel oil. Production of distillate declined 18 percent between 1978 and 1981, slightly more than the 12 percent decline in refinery production of all notroloum products over this period (see Table Si. Coincidental with the decline in distillate production was a reduction in refinery utilization from a rate of 87.8 percent in 1978 to 68.6 percent by 1981. This reflects the decrease in general demand for netroleum products over the period. Refinery inputs of crude oil fell 15 percent, and overall petroleum product demand declined 15 percent during the 3 years.

which nearly doubled in real terms
Distillate imports, while fluctuating
from year to year, averaged 173,000 bar-

Exhibit 4. Distillate Fuel Oil Days of Supply: 1979-1982

Sources: Energy Information Administration, U.S. Department of Energy, Petroleum Statement, Annual, 1979 and 1980; Petroleum Supply Annual 1981; and Petroleum Supply Monthly, (far 1982).

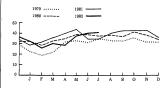

rels per day in 1981, the same level as in 1978. In 1983, market conditions have enabled the United States, for the first time in several years, to export significant quantities of distillate to Mexico, Japan, and Western Europe.

Stock levels of distillate normally follow as pattern of buildings in the late spring and summer, and drawdowns in the fail and summer, and drawdowns in the fail state of the the last several years include:

- Higher interest rates, making inventory holdings more costly;
- Lewer production rates due to a general softening of demand, as discussed earlier, and
  - Increased stocks of crude oil, evidently preferred by refiners to product stocks as a buffer in a period of generally adequate supplies.

Although stocks of distillate have been lower, available days of supply of distillate (primary stocke divided by daily average product supplied) have not shown the same decline (see Exhibit 4). Particularly, in the September-Deember period of each of the 8 years 1979-1981, the number of available days of supply has been roughly similar—

Exhibit 5. Residual Fuel Oil Days of Supply

Sources: E1A, Petroleum Statement, Annual, 1979 and 1980; Petroleum Supply Annual, 1981; and Petroleum Supply Monthly, (for 1982).

dropping from about 80 days at the end of September to about 60 days by year's and. During the remainder of the year, days of supply largely reflect the severity of the winter, with the cold winters of both 1978-1979 and 1981-1982 yielding only 40 days of supply available by the end of April of 1979 and 1988, respectively.

Residual fuel oil (residual) production

declined 21 percent between 1978 and 1981. It is significant, however, that reddual production, unlike that of reddual production, unlike that of reddual production, unlike that of reddual r

End of year stocks of realdual fuel oil, which peaked at 96 million barrels in 1979, fait to 78 million barrels by the end of 1981, a decline of 19 percent. As with distillate, and-of-month stocks were successively lower each month in 1981 and 1982 than in the previous year. Again, this reflects lower prices and demand, and adequate crude oil stocks. As seen in Stabilit 5, however, the decline in residual consumption has meant that available days of supply have been depleted as well able days of supply fail by Albough of this year to less than 30 days, days of supply in May rose to 38 days days of supply in May rose to 38 days do supply in May rose to 38 days do sunoutly to a continuing decrease in demand. This is still lower than 10 liber than in the corresponding rounds of 10 feet and 10 feet in the corresponding rounds of 10 feet and 10 feet.

#### Conclusion

Demand for both distillate and residua; load oils has dropped over the past few years, and end-use consumption patterns have changed. The use of distillate fael oil for heating and the use of residual fuel oil for electrical generation has decreased substantially as traditional customers have shifted to other fuels. In contrast, distillate use for transportation has been increasing.

The general decrease in the use of distillate and residual fuel oils in the domestic market is having a favorable influence on the energy belance of trade, as less product is being imported then in the past several years, and more product is being axported. Based on days of supply measures, current levels of inventories are within historic ranges.

## What are Futures?

Putures are contracts for the delivery of a specified quantity of a commodity on a specified date in the future, at a price which is agreed upon when the contract is executed. The quality of product and the delivery points that will satisfy the contract are also indicated.

Putures contracts differ from more common contractural errangements in that the contracting parties need never must one enother or, indeed, even know who their counterparts are. Further, a most important feature of futures trading is that contracts may be resold many times before the specified delivery date. That is, a futures contract has a market

value that is independent of the delivery price epecified in the contract. Firms and individuals use futures both to "hedge" against future price and supply uncertainty and to "epeculate" on expected price trends. As a tool to reduce sumply uncertainty, the use of futures contracte is straightforward-

the contract guarantees delivery of a certain volume on a certain date. The

use of futures to reduce price uncertainty is more complicated and involves both "short" and "long" hedgers. A short hedger sells a futures contract to "lock in" the price he will receive either for his inventories or for his planned future production. A long hedger buys a futuree contract to "lock

in" his future product coets. It is im-

portant to understand that the nea of futures to hedge against price uncertainty does not require that the firm either take or make delivery of a physipei barrei of oil The efficient use of futures for price-rick hedging is based on the condition that

the value of a firm's cash market position will change by an equal but opposite amount to that of an appropriate futures position. In the long run, the net zein from a successful hedging operation should be zero-the firm neither loses nor profits from any change in cach merket prices. Thus, as important as the capability of avoiding major, unexpected losses, hedging in futures enablee firme to plan and budget more accurately for their future operations.

### Futures Trading on Heating Oil Markets

#### History

Activity in oil futures trading has accolerated considerably since a No. 2 heating oil futures contract was introduced on the New York Mercantila Exchange (NYMEX) in fast 1978. Currently there are petroleum futures markets in heating oil, residual fuel oil, leaded and unleaded gascline, and propara.

In its first year, the NYMEX No. 2 hasing oil futures contract corprision of only light trading volume (10-100 contracts daily). In September 1979, the trading volume and open interest (the number of active contracts) and the quantity of oil involved begin increasing substantially (see Exhibit 1). Three reseases for this increased activity are:

- The disruption of Iranian oil eupplies, which began in 1979, provided price uncertainty and attracted epeculators as well as industry hedgere to the market. World oil prices nearly doubled in 1979, but the rate of pick increase in the last querter was especially sharp.
- Large hosting oil inventories had been built up by fall 1978, partly in response to government inducement to build supplies for the upcoming winter. There had been general concern about the adequesy of hasting oil stocks after nationwide motor geneline shortages that summer. Oil jobbee and distributors fall a med to hadge these switch all inventories.
- When the Iran-Iraq conflict began in September 1980, the No. 2 heading olf utures market had been around long enough for industry and potential speculators to observe sufficient "liquidity" (i.e., a sufficient volume of treding to a sufficient volume of treding to saily closed in the market and to gain confidence in the use of the contracts. With the tremendous

'Bech contract is for 1,000 berrels of heating oil (42,000 gallons) and is priced in cente per gallon. Each cent change reflects the gain or loss of \$420 per contract. uncertainty concerning world oil supplies that arose with the outbreak of the Persian Gulf war, there also arose tremendous opportunities for speculation.

Both the number of contracts and the volume of ell represented by No. 2 hearing oil futures contracts for New York. Harbor delivery increased rapidly after September 1860. By March 1881, the nountily tracing seconded 8,000 contracts of the nountily tracing seconded 1,000 contracts. The availability of occess crude oil on the world market, which become approved early in 1981, in creased the need to hodge inventories, and one of the need to hodge inventories, and one of the need to hodge inventories.

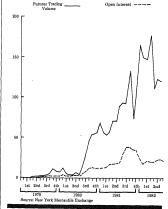

NYMEX trading in heating oil contracts for Gulf Coast delivery was initiated in August 1981. Activity is still much lower than that for the New York Harbor contracts.

#### Impacts on Inventory Strategy

The emergence of an active futures market in heating oil may be influencing the inventory strategies of producers, distributore, and end-users. By purchasing a futures contract, a distributor or end-user can guerantee it will receive a certain volume of product on a given date. Thue, the firm's need to maintain stocks in order to ensure adequate product availability on that date is reduced. At the same time, a producing firm that has high inventories, but is concerned about the possibility either of not being able to sell those stocks or of the future sales price declining, may protect the value of its stocke by selling futures contracts. In this case, the producer may maintein higher inventories then it would if there were no futuree merket. The buying and selling of futures contracts by hedgers at different levels in the industry has the effect of redirecting where stocks will be maintained. Speculatore assist this process in a major way, by compensating for any net difference between hedging sales and purchaeea with their own purchasee end sales. In general, the risk transference made possible by futures hedging, in conjunction with a more efficient dis-

Exhibit 1. No. 2 Heating Oil Futures Trading Volume and Open Interest

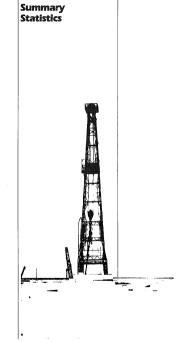

tribution of product inventories, may be expected to result in generally lower optimal stock levels as the volume of futures hedging sctivity increases.

### Impacts on Pricing Strategy

Proponents of energy futures contracts believe that kedging in futures is changing the way the petroloum industry prices its products. As participation in the No. 2 heating oil market by the petroleum industry has increased, it is be-

lieved that futures prices are becoming more which yecopted indicators of free market product values than are eject market quotations. Normal district, contrasts can be based upon futures market prices, as is now the case, In addition, major oil companies may be gin neign futures market prices to determine internal transfer prices between gin neign futures market prices to determine internal transfer prices between fillitates. Finally, the once could reemenge due to futures market heights;

Finding stocks for 1973-1979 are totals as of December 31,

Beginning in 1981 excludes blending components.

A negative number indicates an increase in stocks and a positive number indicates a decrease. 4 Includes motor gasoline blanding components.

<sup>5</sup> Includes pasohol. Totals may not equal sum of components due to independent rounding.

(f) = Loss than 500 barrels. NA = Not available. R = Boulaed data.

<sup>(\*) =</sup> Loss than 800 barrels. \* See Explanatory Note 5.3.

<sup>&</sup>quot; Preliminary statistics. See Explanatory Note 2.7.

Notes: Beginning in January 1881, the Energy Information Administration modified survey forms, definitions, and processing procedures. See Explanatory Note 4 on Changes for the effects on motor gasoline statistics. Annual stock changes for 1975 and 1981 were calculated using expanded survey coverage. Geographic coverage: The 50 United States and the Dietrict of Columbia.

Sources: See "Sources" at the end of this section.

## Glossary

## Definitions of Petroleum Products and Other Terms

Alcohol. The family name of a group of organic chemical compounds composed of carbon, hydregen, and oxygen. The series of melecules vary in chain length and are composed of a hydrocarbon plus a hydroxyl group, CH-(CH)n-OH, "Alcohol" includes ethanol and methanol.

Asphalt. A dark-brown-to-black cement-like material, containing bitumens—as the predominant constituents, obtained by petroleum processing. The definition includes crude asphalt as well as the following finished products: cements, fluxes, the asphalt content of empisions (exclusive water), and petroleum distillates blended with asphalt to make outback asphalts. The conversion factor is 6.5 42-stillen harrels per abort ton.

ASTM. The acronym for the American Society for Testing and Materials.

Aviation Gasoline Blending Components. Finished components in the gasoline range which will be used for blending or compounding into finished aviation gasoline.

Aviation Gasoline (Phished). All apecial grades of gasoline for use in aviation reciprocating angines, as given in ASTM Specification D 910 and Military Specification MIL\_G-6562.

Barrell. A volumetric unit of measure for conde oil and netroleum products somivalent to 42 U.S.

Barrel. A volumetric unit of measure for crude oil and petroleum products equivalent to 42 U.S. gallons. This measure is used in meet statistical reports. Pactors for converting petroleum coke, asphal; and wax to barrels are given in the definitions for these products.

Butane. A normally gaseous paraffinic hydrocarbon,  $C_iH_{in}$ . It is extracted from natural gas or refinery gas streams. Butane is covered by ASTM Specification D1835 and Gas Processors Association Specification for commercial butane.

Normal Butane—A saturated straight-chain hydrocarbon of butane. It is a colorless paraffinic
gas that boils at a temperature of 31.1° F. This classification includes mixtures of gases that
contain 80 percent or more normal butane.

· Other Butanes-All butanes not included as normal butane or isobutane.

Butane-Propase Mixtures. Mixtures consisting exclusively of botane and propane that conform to ARTM Specification D1838 and Gas Processors Specification for commercial butane-propane. They are extracted from natural gas and refinery gas streams.

Butylene. An olefinic hydrocarbon, CaHa recovered from refinery processes. It is reported in the "Butane" estegury.

Coal. A generic tarm applied to carbonaceous rocks that were formed by the partial or complete decomposition of vegetation. These stratified carbonaceous rocks are either soll or brittle and are highly combostible. Includes lignite, bituminous coal, and anthracits which conform to ASTM Specification D 388.

Crude Oil (Reducting Lease Condensate). A mixture of hydrocarbons that existed in liquid phase in undergrand reservoirs and remain lain quite at atmospheric pressure after passing through surface separating facilities. Lease condensate is included. Drips are also included, but topoed crude (realized) oil another ministrate did sea excitotical. Chrustia produced the stateral gas processing plants and mixed with crude oil are likewise scientific about the condensate in the cond

Domestic—Crude oil produced in the United States or from its outer continental shelf as defined
in 43 U.S.C. 1331. Hydrocarbons such as shale oil and tar sand oil are included.

 Foreign—Crude oil produced outside the United States. Imported Athabasca hydrocarbons are included. Distillate Fuel Oil. A general classification for one of the petroleum fractions produced in conventional distillation operations. It is used primarily for space heating, on: and-off-highway dised engine fuel (including ratificed engine fuel and foel for agricultural machinery), and electric power generation. Included are products known as No. 1 and No. 2 heating oils, No. 1 and No. 2 dised fuel oils, and No. 4 fuel oil.

- No. 1 Fuel Oil—A light distillate fuel oil intended for vaporizing pot-type burners. ASTM Specification D 386 specifies for this grade maximum distillation temperatures of 400° F. at the 10-percent point and 550° F. at the 90-percent point, and kinematic viscosities between 1.4 and 2.2 centicates at 100° F.
- No. 2 Fuel Oil—A distillate fuel oil for domestic heating for use in atomizing-type burners or for moderate expacity commercial-industrial burner units. ASTM Specification D 398 specifies for this grade temperatures at the 90-percent point between 540° and 640° F., and kinematic viscosities between 2.0 and 3.6 centiatoke at 100° F.
- No. 1 and No. 2 Diesel Fuel Oils—Distillate fuel oils used in compression-ignition engines, as given by ASTM Specification D 975:
  - No. 1-D—A volatile distillate fuel oil in the 400° to 550° F, boiling range for engines in service requiring frequent speed and load changes. Type C-B diesel fuel, which is used for city buses and dimilar operations, is included.
  - No. 2-D—A distillate fuel oil of lower volatility in the 540° to 640° F, boiling range for engines in industrial and heavy mobile service. Type R-R diesel fuel for railroad compression-ignition engines and Type T-T for diesel-engine tracks are included.
- No. 4, Fuel Oil—A fuel oil for commercial turner installations not quipped with probesting facilities. It lue and extransively in industrial plants. This grade is a binnel of distillate fuel oil are residual fuel oil stocks that conforms to ASTM Specification 1986 or Fuderal Specification VVF-9.18C; in distinguish control with the conforms to ASTM Specification 1986 or Fuderal Specification (VVF-9.18C), in distinguish the tomorphism of the conformation of the

Eastern Hemisphere. That half of the earth east of the Atlantic Ocean which includes Europe, Asia, Africa, and Australia. The Hawalian Foreign Trade Zone is in this hemisphere.

Electric Energy (Purchased). Electricity purchased for refinery operations that is not produced within the refinery complex.

Ethane. A normally gaseous paraffinic hydrocarbon, C<sub>1</sub>Ha, extracted from natural gas and refinery cus streams. "Ethane" includes any product containing 90 percent liquid volume or more sthane.

Ethane-Propane Mixtures. Mixtures of ethane and propane in which neither component is 90 percent

or more of the liquid volume. It is extracted for natural gas and refinery gas streams.

Ethylene. An olefinic hydrosarbon, C<sub>3</sub>H<sub>4</sub>, recovered from refinery and petrochemical processes. It is

Field Production. Represents crude oil production on leases, natural gas liquids production at natural gas propossing plants, and new supply of other hydrocarbons and alcohol.

Gas Well Gas. Natural gas produced from gas wells. Such gas may be either associated gas or non-associated gas.

- Associated Gas.—Free natural gas in immediate contact, but not in solution, with crude oil in the
  resource.
- Non-Associated Gas-Free natural gas not in contact with, nor dissolved in, crude oil in the

Imported Crude Oil Burned as Fuel. The amount of foreign crude oil burned as a fuel oil, usually as residual fuel oil, without being processed as such. "Imported crude oil burned as fuel" includes lease condensate and liquid hydrocarbons produced from tar said oil, gilbonite, and oil shale.

recervoir.

renorted in the "Ethane" category.

Isobutane. A saturated branch-chain isomer of butane. It is a coloriess paraffinic gas that boils its temperature of 10.9° F. This classification includes mixtures of gases that contain 80 percent liquid volume or more isobutane. It is extracted from natural gas and refinery gas streams.

Isopentane. A saturated branch-chain hydrocarbon, C<sub>5</sub>H<sub>15</sub>, obtained by fractionation of natural gasoline or isomerization of normal pentane.

Kerossee. A petroleum distillate dast bolls at a temperature between 30° and 580° P., that has fluch point higher than 100° P. by ASTM bledd D 58, that has a gravity range from 40° tes 47° All point has a barriage point in the range of 150° to 17° F. It is a clean-burning product suisible for one as a librariage to the burnel is wisk hamps, including sprache of krossees called range of Maring product since in the state of the control of the state of the state of the control of the state of

Kerosene-Type Jet Fuel. A quality kerosene product with an average gravity of 40.7° API, a 10 percent distillation temperature of 400° F., and an end-point of 572° F. It is covered by ASIM Specification D 1655 and Military Specification MILT-5824L (Grade JP-6 and JP-8). It is usel primarily for commercial utrebeit and turboprop aircraft engine.

Leave Condensate. A natural gas liquid recovered from gas well gas (associated and non-associated) in leave separators or natural gas field facilities. Leave condensate consists primarily of pentanes and heavier hydrocarbons.

Lease Separator. A turface facility used for separating casinghead gas from produced crude oil and water and separating gas from that pertion of associated gas and non-associated gas that liquefies at the temperature and pressure conditions of the separator.

Liquefied Petroleum Gases (LPG). Propane, propylene, butanes, butylene, ethane-propane mixtures, and isobutane produced at refineries or natural gas processing plants, including plants that fractionals raw natural gas plant liquids. Permerly called "Liquefied Gases."

Liques field Refinery Gasses (LRG). Liquesfiel petroleum gasses fractionsed from refinery or still gasse. Through compression under refigeration they are retained in the liquid stats. The reported extegering are eithen another eddyren, postness another proprieme, butten another budylens, butten-propriem mixtures, and insolutions. Evaluate still gases used for chemical or rubber manutatures which are reported as petroleumical flecthrecks and also excluded liquesting gases ready for biending into genolism states. The control of the petroleumical flecthrecks and a lower personal for the petroleumical flecthrecks and a lower personal for the petroleumical flecthrecks and the control of the petroleumical flecthrecks and the control of the petroleumical flecthrecks and the control of the petroleumical flecthrecks and the control of the petroleumical flecthrecks and the control of the petroleumical flecthrecks and the control of the petroleumical flecthrecks and the control of the petroleumical flecthrecks and the control of the petroleumical flecthrecks and the control of the petroleumical flecthrecks and the control of the petroleum and the petroleumical flecthrecks and the petroleum a

Lubricanta. A substance used to reduce friction between bearing surfaces. Petroleam lubricants may be produced either from distillates or residues. Other mubitanes may be added to impart or improve certain required properties. "Lubricants" includes all grades of lubricating oils from spindle oil to crilidor oil and done used in greaces. The three enterestics reported are:

 Bright Stock—A refined, high viscosity lubricating oil base stock that is usually made from a residuum by a treatment such as deasphalting, acid treatment, or solvent extraction.

 Neutral—A distillate subricating oil bage stock with a viscosity that is usually not above 550 Saybult Universal Seconds (SUS) at 100° F. It is prepared by a treatment such as hydrofining, and treatment, or solvent extraction.

 Other—A lubricating oil base stock used in finished lubricating oils and greases, including black, coastal, and red oils.

Miscellaneeus Products. Includes all finished products not classified elsewhere. "Miscollaneous products" include petrolatum, absorption ells, ram-jet fuel, petroleum rocket fuels, synthetic natural gas feedstocks, and other finished products.

Motor Gasoline Blending Components. Finished components in the gasoline range that will be used for blending or compounding into finished motor gasoline. Pool gasoline is included in this category.

Motor Gasoline (Finished). A complex mixture of relatively volatile hydrocarbons, with or without small quantities of additives, that have been blended to form a fuel suitable for use in spark-ignition engines. Specifications for motor gascline, as given in ASTM Specification D 489 or Pederal Spacification VV-0-1890B, include a boiling range of 122° to 188° P, at the 10-percent point to 886° to 374° P, at the 90-percent point and a Reid vapor pressure range from 9 to 15 psi. "Motor gascline" includes finished leaded gasoline, finished unleaded gasoline, and gasoho, Blendstock is excluded until blending has been completed. Allowide that is to be used in the blending for gasobil as she excluded.

Finished Leaded Gasoline—Contains more than 0.05 grams of lead per gallon or more than
0.05 grams of phosphorus per gallon. The actual lead content of any given gallon, however, may
vary as a function of the six of the producer and company according to specific Environmental
Protection Agency waiver provisions. Premium and regular grades are included, depending on
the octane retain.

 Finished Unleaded Gasoline—Contains up to 0.05 grams of lead per gallon and 0.005 grams of phosphorus per gallon. Premium and regular grades are included, depending on the octane rating.

 Gasohol—A blend of alcohol and finished motor gasoline that is no more than 30 percent of finished motor gasoline (leaded or unleaded as described above) and no less than 10 percent or more alcohol (ethanol or methanol).

Motor Gasoline (Total). Includes finished leaded meter gasoline, finished unleaded meter gasoline, motor gasoline blending components, and gasohel.

Naghtha-Type Jet Fuel. A fuel in the heavy naphtha boiling range with an average gravity of \$2.8° API and 20 to 90 percent distillation temperatures of \$20° to 40° P., meeting Military Specification MILT-96824. (Grade JP-4, JP-4 is used for turboight and turboprop aircraft engines, primarily by the military. This category excludes rannjet and petroleum rocket fuels, which are included in the "Miscellagous products" category.

Natural Gas. A mixture of hydrocarbons and small quantities of various nonhydrocarbons existing in the gaseous phase or in solution with crude oil in underground reservoirs.

Natural Gas Fleid Facility. A field facility designed to process natural gas produced from more than one lease for the purpose of recovering condensets from a stream of natural gas, however, some fidel facilities are designed to recover propane, butane, natural gasoline, etc., and to control the quality of natural gas to be marketed.

Natural Gas Pinnt Liquida. Natural gas liquida recovered from natural gas in gas processing plants, and in some situations, from matural gas field diellies. Natural gas il quidas extracted by fractionation are also included. These liquida sex defined facellies. Natural gas liquidas extracted by fractionation are also included. These liquida sex defined according to the published specifications of the Ossessors Association and the American Societies for Testing and Matarrisia, and are classified us follows: Ethicas, program, ethicas-propages mits, independent, butter, program, ethicas-propages mits, independent, butter, butter, butter, program ethic, independent, contained, butter, program ethic, independent, and other product for matural gas marrial gas independent endomination, independent of the program

Natural Gas Processing Plant. A facility designed to recover natural gas liquids from a stream of natural gas that may or may not have been processed through least esperators or natural gas that may or may not have been processed through least esperators or natural gas least feel facilities. The facility also controls the quality of natural gas to be marketed. Cycling plants are classified as gas no recessing blants.

Natural Gasoline. A mixture of hydrocarbons, mostly pentanes and heavier, extracted from naturals, that meets vapor pressure, end-point, and other specifications for natural gasoline set by the C Producers Association.

OPEC. The acronym for the Organization of Petroleam Exporting Countries, oil-producing a exporting countries that have organized for the purpose of negotiating with oil companies on matter oil production, prices, and future concession rights. Current members are Algeria, Eccauder, Gal Indonesis, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, United Arab Emirates, Venezuala.

Operable Distillation Capacity. The maximum amount of input that can be processed by a crudistillation unit in a 24-hour period, making allowances for processing limitations due to type grades of inputs, limitations of downstream facilities, scheduled and unscheduled downstman. a cavironmental constraints, includes any shutdown capacity that could be placed in operation within days.

Other Hydrocarbons, Materials received by a refinery and consumed as raw materials, lacture.

hydrogen, coal, tar derivatives, gilsonite, and natural gas received by the refinery for reforming in hydrogen. Natural gas to be used as fuel is excluded.

Petrochemical Feedstocks. Chemical feedstocks derived from petroleum, principally for the maximum.

facture of synthetic rubber and a warfety of plastics. The estegories reported are "Naphthaless th 400° F. end-point" and "Other oils over 400° F. end-point."

Naphthaless than 400° F. end-noine—A naphtha with a need point of less than 400° F. and tha

- Naphtha less than 400° F, end-point—A naphtha with an end point of less than 400° F, and the
  reported as used as a petrochemical feedstock.
- Other oils over  $400^\circ$  F. and that are reported used as a petrochemical feedstock.

Petroleum Coke. A residue, the final product of the condensation process in cracking. This product reported as marketable coke or catalyst coke. The conversion factor is 542-gallon barrels per short!

- Marketable Coke—Those grades of coke that are produced in delayed or fluid cokers and when ye recovered as relatively pure carbon. This "green" coke may be sold or further purified calcining.
- Catalyst Coke—in many catalytic operations (i.e., catalytic cracking) carbon is deposited on catalyst, thus deactivating the catalyst. The catalyst is reactivated by burning off the carb which is used as fuel in the refinery process. This carbon or coke is not recoverable in

Partners Products. Persons products are abstract from the processing of code oil (factors conclusion), and the products are abstract from the products and enter a factor and the products and confinited oils, natural goals lead in operation, plant conclusate, unfortunated oils, natural goals and inoperation, plant conclusate, unfractionated stream, office liquidity persons, oil (all partners products) are producted persons, oil (all partners products) are producted persons, oil (all partners products) are producted persons, oil (all partners products) are producted persons, oil (all partners products) are producted persons, or (all partners products) are producted persons, or (all partners persons, variety persons only (all partners) are producted persons of the product persons of the persons of the product persons of the product persons of the product persons of the product persons of the product persons of the persons of the product persons of the product persons of the pe

Petroleum Refinery. An installation that manufactures finished petroleum products from crude unfinished oils, natural gas plant liquids, other hydrocarbons, and alcohol.

Plant Condensate. One of the natural gas plant liquids, mostly pentanes and heavier hydrorarb recovered and separated as liquids at gas inlet separators or scrubbers in processing plants.

Primary Stocke. Stocks of crude oil or petroleum products held in storage at (or in) leases, refiner natural gas processing plants, pipelines, tankfarms, and bulk terminals that can store at less 5.00 barries of protection products or that can receive petroleum products by entance happen, or pipel of the products of the products of the products of the products of the store of an Pederal states or in the Strategie Petroleum Confederal Confederation Confederat

Propane. A normally gaseous hydrocarton, C<sub>2</sub>H<sub>8</sub> extracted from natural gas and refinery gas stres. It is used primarily as a fuel and as a petrochemical feedstock. Propane is covered by AS Specification D1836, Gas Processors Association for commercial and HD-6 propane, and AS Specification for special city propane.

Propylene. An elefinic hydrocarbon,  $C_2H_4$ , recovered from refinery and petrochemical processes, reported in the "Propane" category.

Residual Fuel Oll. Topped crude of refinery operations. "Residual Fuel Oll" includes No. 5 and Nel Oll is a defined in ASTM Specification D 396 and Paderal Specification VV-F-815C/Navy-Fight Oll is a defined in Military Specification MILIL-389E including Amendment 2; Bunker C fuel Residual fuel Oll is used for the production of electric power, space heating, vessel bunkering, arrafuss industrial purposes. Improst of residual fuel oil include "Improrted Crude Oil Burned as Fr

concentrated form.

Road Oil. Any heavy petroleum oil, including residual asphaltic oils, used as a dust palliative and surface treatment of roads and highways. It is generally produced in six grades; from 0, the most liquid, to 5, the most viscous.

Special Naphthas, All finished preducts within the gualitie range that are used as paint thinners, cleaners, and obsents. These proteints are refined to a specified flash point and have a boiling range of 90° to 200° P. "Special naphthas" includes all commercial becames and cleaning solvents conforming to ASTM Specifications D1886 and D 484, respectively. Naphthas to be binned of marketed as motor gasoline or winting ascellated as motor gasoline or winting the conformation of the c

Steam (Purchased). Steam that is purchased for use by a refinery that was not generated from within the refinery complex.

Still Gas (Refinery Gas). Any form or mixture of gas produced in refiner in by distillation, cracking, reforming, and other processes. The principal constituents are methane, ethica, buttane, butylene, bropane, propylene, etc. Still gas is reported for petrochemical feedstock use and refinery fuel use.

 Petrochemical Feedstock Use—Includes all refinery streams which are used by chemical or rabber manufacturing operations for further processing, less the amount of such stream returned to the source refinery. Finished petrochemical products are not included. For example, polyethylene, butsdiene, etc. are considered petrochemical products; therefore, only their feedstock equivalents are included.

· Fuel Use-All other still gas.

Strategic Petroleum Reserve (SPR). Stocks (currently, only crude oil) maintained by the Feder Government for use during periods of major supply interruption.

Unfinished Oils. Includes all oils requiring further processing, except those requiring only mechanic blending.

Unfractionated Stream. Mixtures of unsegregated natural gas plant liquid components excludin those included in plant condensate. This product is extracted from natural gas.

Wax. A solid or sent-isolid material derived from petroleum distillates or resides by soch restances, as chilling, perceptiating with a solven, or deciling, it is a light-locker, nor-or-leus transverse crystalline mass, slightly greaty to the touch, consisting of anixture of solid hydrocarbons in which paraffin series profouniates, includes all markatable axt whether cryotes cale or fally reflicted. The three grades reported are microcrystalline, crystalline-fully refined, and crystalline-other. The conversion factor 1280 possible per 42 gallots barrel.

 Microcrystalline Wax—Wax extracted from certain petroleum residues having a finer and les apparent crystalline structure than paraffin wax and having the following physical chara teristics:

Penetration at 77° F. (D-1321)—60 maximum. Viscosity at 210° F. in Saybolt Universal Seconds (SUS) (D-83)—60 SUS (10.22 centistokes) minimum to 150 SUS (21.8 centistokes) maximum

 Crystalline-Fully Refined Wax-A light-colored paraffin wax having the following charateristics:

Viscosity at 210° F.

(D-88)—55.9 SUS (10.18 centistokes) maximum.

Oil Content (D-721)—0.5 percent maximum.

Other +20 color. Saybolt minimum.

Oil content (D-721)-5 percent minimum.

 Crystalline-Other Wax—A paraffin wax having the following characteristics: Viscosity at 210° F. (D-88)—59.9 SUS (0.18 centistokes) maximum. Oil Content (D-72)—0.51 percent minimum to 15 percent maximum.

Western Hemisphere. That half of the earth that includes North and South America and the surrounding waters.

## Explanato Notes

# Explanatory | Note 1.1 EIA-64: Natural Gas Liquids Operations Report

## Background

The EIA-64, "Natural Gas Liquids Operations Report" evolved from a survey designed and conducted by the United States Geological Survey beginning in 1911. This form collects data on the production ani storage of statural gas processing plants and fractionators.

## Description of Survey

## Tiniparpa

The universe includes all operators of facilities designed to: (1) extract liquid hydrocarbons from natural gas steems (natural gas processing plants); (2) separate a combined products liquid hydrocarbon stream into its component products, i.e. propane, betane, natural gasoline, etc. (fractionstream care the liquid hydrocarbon output of plants and fractionators.

The mailing list is automated. It is maintained by matching periodically with the LP Gas Almanor listings (including supplements) and the Oil and Gas Journal Processing Plant Survey listings, and by making changes reported by the respondents.

#### Information Collected

The data are submitted monthly by facility and include all products that the company controls through possession, regardless of ownership. The main items of information collected by the EIA-64 are shown by the example of the form presented below.

## Collection Methods

Completed reports are required to be postmarked 20 days following the last day of the report month Follow-up telephone calls are made to nonrespondents in order to collect data before publication of the aggregated data.

#### Imputing Missing Data

Imputation is performed only for companies that submitted a report in the previous month. For and companies, previous monthly whose are used for current values. The previous monthly ending stock value is used for both the current monthly beginning stocks and the current menthly ending stock value is used for both the current monthly beginning stocks and the current menthly ending stocks. The value of adjuments is editable to be able to the companies of the current menthly ending stocks. The three values of adjuments is editable to the vent that the previous monthly data were estimated, the respondent is contacted and requested to monthly ending the companies of the contact of the companies of the contact of the companies of the contact of the companies of the contact of the c

## Response Rates

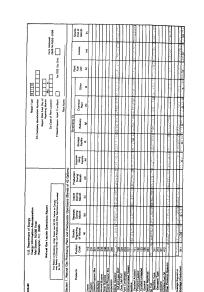

The initial response rate averages 85 percent, with a final response averaging 98 percent as a result of telephone follow-up procedures.

## 89 and 90: Joint Petroleum Reporting

stem (JPRS) comprises four surveys: the "Refinery Report" (EIAsort" (EIA-88); the "Pipeline Products Report" (EIA-89); and the

"Cruck Oil Stocks Report" (E1A-90). This group of forms collects data on petroleum refinery opera and on storage of crute oil and petroleum products. The origins of JPRS lie in the voluntary opera reporting systems instituted by the Burcau of Mines (BOM) soon after it was established as a part. Demarkment of the Interior in May 1910.

## Description of Survey

#### Universe

The respondent universe of each JPRS survey is defined as follows:

annual survey EIA-177 "Canacity of Petroleum Refineries."

EIA-87: All petroleum refineries and plants producing finished motor gasoline through mechanical blending of liquids which are operated or controlled in the 50 States, the Distri Columbia, Paerto Rico, the Virgin Islands, Hawaiian Foreign Trade Zono, and Guam.

EIA-88: All bulk terminal facilities in the 50 States and the District of Columbia, Puerto Rico, an Virgin Islands that (a) have total belk storage capacity of 50,000 barrols or more and/or (b) re petroleum products by tanker, barge, or pipeline regardless of ownership of the material.

BIA-89: All products pipeline companies that carry petroleum products (including interintrastate and intracompany pipelines) in the 50 States and the District of Columbia.

EIA-90: Crude oil pipeline companies (gathering and trunk pipeline companies), crude oil produ terminal operators, storers of crude oil, and companies transporting Alaskan crude oil by wate access of 1,000 barrels), regardless of ownership in the 60 States and the District of Columbia.

The list of respondents is kept current by checking for new respondents in the Oil and Gas Jos weekly magazine, newspaper articles; the Office of Resource Applications published "Tree Refinery Canacity & Utilization" the Office of Refinery Congrations (FRA) lists of I(S. Refiners on

#### Information Collected

The main items of information collected by BIA-87, are shown by the example presented below BIA-88 and BIA-89 collect dats on petroleum product stocks. The BIA-90 collects dats on crustocks and crude oil used directly as fuel.

#### Collection Methods

The data for the JPRS surveys are collected on a monthly basis. Completed forms are required postmarked by the 20th day following the report month. Telephone follow-up calls are man sonrespondents in order to collect data before publication deadline. An automated mailing I maintained and is used to monitor sender of the control of the

#### Imputing Missing Data

Imputation is performed only for companies that submitted a report in the previous month. For companies, the previous monthly where are used for current values. The previous month is ending as value of sused for both the current menth's beginning tables and the current month's ending tocks used for the current menth's sending tocks are used for the current menth's sending tocks used for the current menth's sending tocks are used for the current menth's sending tocks used to the current menth's sending tocks used to the current menths are used for the current menths are used for the current mention and the current mention and the current mention are used to the current mention and the current mention are used to the current mention are used to the current mention and the current mention are used to the current mention and the current mention are used to the current mention are used to the current mention are used for the current mention are used to the current mention are used to the current mention are used for the current mention are used to the current mention are used to the current mention are used for the current mention are

#### Response Rates

As of the filing deadline, the response rate of the PPES reproducts is over 40 percent. All comp that have not responded are constanted to telephone. Although data are taken by telephone the exp processing, a certified submission is still required. Thirty catender day after the report month, data companies that still fail to file the form are estimated based on price or seat report month, data. Names of comp that fall to file for two consecutive months are forwarded to DOE for further monomphilaces at

## Note 1.3 EIA-161, 162, 163, 164 and 165: Weekly Petroleum Reporting System

#### Background

The Weekly Petroleum Reporting System (WPRS) comprises five surveys: the "Refinery Report" (E1A-161); the "Bln! Ferminal Stocks Report" (E1A-162); the "Pipeline Product Stock Report" (E1A-163); the "Cyude Oil Stocks Report" (E1A-164); and the "Imports Report" (E1A-164);

The EIA weekly reporting system was dissigned to collect data similar to those collected unfor the monthly joint Parloman Reporting System(PRS) (See Note 1.2. In the WPSS, selected partering monthly of the Parloman Reporting system product injust on the Parloman Reporting system product injust on the Parloman RIA-of through EIA-dis production, and cross oil and parteriors product injusts and production and parteriors are producted injusts on the Parloman EIA-of through EIA-dis, the parloman Reporting System

#### Description of Survey

#### Universe

The sample of companies that report weekly in the WPRS was selected from the universe of companies that report monthly in either the JPRS system or the ERA-60 system (for imports). All sampled companies report data only for facilities in the fit States and the District of Columbia.

The sampling frame for each weekly survey is defined as follows:

EIA-161: Uses the EIA-87 universa, which includes all petroleum refineries in the United States and its territories, industrial facilities that have crude oil distillation capacity and produce some refixed petroleum products, and bulk terminals that blend motor gasoline.

EIA – IeS: Uses the EIA – 88 universe, which includes all bulk terminal facilities in the Uited States and its territories that have total bulk storage capacity of 50,000 barrels or more, or that receive petroleum products by tanker, barge, or pipeline.

EIA—168: Based on the EIA-69 universe, which includes all petroleum product pipeline companies in the United States and its territories that transport refined petroleum products, including interstate, intrastate and intracompany pipeline movements. Pipeline companies that only transport natural gas liquidase not included in the EIA-168 frame. Only those pipeline companies which transport products covered in the weekly survey are included.

EIA-164: Uses the EIA-90 universe, which consists of all trunk pipeline companies in the United States and its territories which transport crude oil, all refining companies, all crude oil producers, all terminal operators, and all storres of 1000 barrels or more of crude oil.

EIA-165: Uses the ERA-60 universe, which includes all importers of record of crude oil and petroleum products into the United States and Puerto Rico.

## Sampling

The sampling procedure used for the weakly system is the cut-off method. In the cut-off method, companies are ranked from largest to smallest on the basis of the quantities reported during some previous period. Companies are chosen for the sample beginning with the largest and adding companies until the total sample covers above 30 overest of the total for the previous time period.

#### Callection Methods

Data are collected by mail, mailgram, helphone, Telex, and Telefax on a weekly basis. All canvasced tirms and terminal operating companies must file by Kel0 p.m. on the Monday following the closed the report period, 7 a.m. Friday. During the processing week, company corrections of the prior week's data are also entered.

#### Formula and Calculations

After the company reports have been checked and entered into the weekly data base, ratio estimates of the weekly totals are calculated from the reported data.

First, the current week's data for a given product reported by companies in that region are summed. (Call this weekly sum, W.) Next, the most recent month's data for the product reported by those same companies are summed. (Call this monthly sum, M.). Finally, let M. be the sum of the most recent month's data for the product as reported by all companies. Then, the current week's ratio estimate for that product for all companies is given by.

$$W_1 = \frac{M_1}{M_1} \circ W_2$$

This procedure is used directly to estimate total weekly inputs to refineries and production.

To estimate stocks of finished products, the preceding procedure is followed separately for refineries, bulk terminals, and pipelines. Total estimates are formed by summing over establishment types.

Weekly imports data are highly variable on a company-by-company basis or a week-by-week basis. Under such conditions, the ratio method is known to result in large errors. Hence, a number of the procedures for estimating weekly imports were considered. The average ratio method was selected for estimating imports because it produces estimating imports because it produces estimating imports because it produces estimations in the color observable values computed monthly data. Estimates are obtained using the ratio method, but with each company in turn omitty from the sample. These estimates are then averaged to do that the average to do that the key server good sufficient of the contract of the c

#### Imputing Missing Data

The ratio method of estimation automatically imputes for nonresponse. Data from companies that do no respond are excluded from both the weekly and the monthly totals for the sampled companies.

#### Response Retes

The response rate as of the day after the filing deadline is about 80 percent for the EIA-181, 76 percent for the EIA-182, 80 percent for the EIA-182, 80 percent for the BIA-182, 80 percent for the BIA-184, and greater than 80 percent for the BIA-184, and greater than 80 percent are received the next day, bringing the final response rates up Late respondents are contacted by telephone. Nearly all of the major companies report on time. The morresponse rate of the outbilled estimates is usually between 2 percent and 6 percent.

## Note 1.4 EIA-170: Tanker and Barge Shipments of Crude O and Petroleum Products Between Districts

#### Background

The EIA-170 survey collects data for calculation of monthly petroleum supply and disposition figures on HS and PAD District levels

#### Instrument and Design

This form is designed to collect data on total movements by tanker and barge of crude oil and petrolsum products between PAD Districts or between PAD Districts and the Penama Canal, by shipping State and receiving State.

#### Universe

The respondent universe of the BIA-170 consists of all known companies and plants that have custody of crude oil and petroleum products transported by tanker and barge between PAD Districts or between PAD Districts and the Panams Gand. There are currently about 60 respondents.

#### Collection Methods

Survey data are collected by mail every month. The filing deadline is the 20th calendar day of the month following the report period. The response rate as of the filing deadline is about 38 percent. Late respondents are contacted by telephone. All responses are processed each month before release of the data for publication.

## Note 1.5 ERA-60: Reports of Oil Imports into the United States and Puerto Rico

#### Background

The "Report of Oil Imports into the United States and Powtra Rice" (ERA-40) survey was designed by the Economic Regulation (ERA) of the Department of Energy to collect date on per tof entry, ownering of the Committee Regulation (ERA) of the Department of Energy to collect date on per tof entry, ownerly of origin, destination, and quantity of imported crude oil and petroleum products, a well assilter content and AF graverly. All licensed importers and importers of record are required to apport. The "Shipments of Refined Products from Puerts Rico to the United States" (P-135-M-O) survey was designed to oblice date on imports to the United States that are not covered by the ERA-40.

#### Universe

The monthly submission of Form RRA—00 and P-133-M—0 is required by all licensed importers and importers of record into the United States and Puerto Ricc. The respondent universe consisted of approximately 760 firms as of June 90, 1981. The respondent universe for these surveys is updated whenever an innovar license is crasted to the Office of Oil Imports of the BRA.

#### Collection Methods

The survey data are collected by mail each month. It is mandatory for each respondent to file the ERA-60/P-133-M-O by the 18th working day of the month following the reporting period. Resumbnissions are received frequently and are processed when received.

## Response Rates

In December 1990, the survey had a response rate of \$2 percent by the filling deadline. The authrees was default at that time, Glename this is a quantic survey, the outiveze is constantly chancing, \$1 Standard follow-up of nonrespondents is made to insure that all reports are received, throe data are not imputed follow-up of nonrespondents. Suppose rate is generally \$6.95%; but the the data are not imputed for publications are not generated as grandered procedure. The ERA-80 file is never closed; resultantions to constantly received and processed.

## Note 1.6 Census Import (IM-145) and Export (EM-522 and EM-594) Tabulations

The foreign trade statistics program, conducted by the Bureau of the Census, involves compilation and dissemination of a large body of data relating to the imports and exports of the United States.

## Import Statistics

#### Coverage

The import statistics reflect both government and nongovernment imports of merchandise from fariging countries into the U.S. Customs territory (includes the 60 States, the District of Columbia, and Poerto Réo.), without regard to whether or not a commercial transaction is involved. In general, the statistics record the physical movement of merchandise into the United States from foreign countries, with the exception of the following types of transactions that are excluded from the statistics:

- Merchandise shipped in transit through the United States, when documented with Customs as an intransit movement.
  - Shipments between the United States and Puerto Rico, the Virgin Islands, Guam, American Samoa, and other U.S. possessions; shipments between any of these outlying areas; and imports into U.S. possessions from foreign countries.
- 3. U.S. merchandise returned by U.S. Armed Forces for their own use.

## Source of Import Information The official U.S. import statistic

The official U.S. import statistics are compiled by the Bureau of the Census from copies of the import entry and warehouse withdrawal forms that importers are required by law to file with Customs officials (Customs Forms 7891 - 7896).

Imported petroleum is reported as "imports for Consumption." Imports for consumption are a combination of entries for immediate consumption and withdrawals from ware closure for consumption. With certain exceptions as indicated above, these data generally reflect the total of commodities entered into U.S. consumption.

#### Country and Area of Origin

The country reported in the statistics as the country of origin is defined as the country where the merchandise was grown, mined, or manufactured. In instances where the country of origin cannot be determined, the transactions are credited to the country of shipment.

## Export Statistics

#### Coverage

The export statistics reflect both government and negovernment exports of demestic and foreign merchandise from the U.S. Customs territory (neludes the 50 States, the District of Columbia, and Puerto Rico) to foreign countries, without regard to whether or not the exportation involves a commercial transaction. In general, the statistics record the physical movement of merchandise out of the United States to foreign countries, with the execution of the following trees of transactions:

- Shipments between the United States and Puerto Rico, the Virgin Islands, Guam, American Samoa, and other U.S. possessions; between any of these outlying areas; and shipments from U.S. Possessions to foreign countries.
- Merchandise shipped in transit through the United States from one foreign country to another, wher documented as such with U.S. Customs.
- Bunker fuels and other supplies and equipment for use on departing vessels, planes, or other carrie engaged in foreign trade,

#### Source of Export Information

The official U.S. export statistics are compiled by the Bureau of the Census primarily from copies of Shipper's Export Declarations. Shipper's Export Declarations are required to be filed with Catacutofficials, except when qualified exporters have been subther into excluding that is the form of magnetic tape, punched cards, or monthly Shipper's Summary Export Declarations directly to the Bureau of the Cossus.

#### Country and Area of Destination

The country of destination is defined as the country of ultimate destination or the country where the goods are to be consumed, further processed, or manufactured, as known to the shipper at the time of exportation. If the shipper des on known the country of ultimate destination, the shipment is credited to the last country to which the shipper knows that the merchandise will be shipped in the same form as it was when exported.

#### Collection Methods

Survey data are collected by mail every month. The filling deadline is the 20th calendar day of the month following the report period. The response rate as of the filling deadline is about 98 percent. Late respondents are contacted by telephone. All responses are processed each month before release of the data for publication.

## Note 1.5 ERA-60: Reports of Oil Imports into the United States and Puerto Rico

#### Background

The "Report of Oil Imports into the United States and Puerto Rico" (RRA-60) survey was designed by the Economic Regulatory Administration (RRA) of the Department of Emergia to collect data super for entry, country of origin, destination, and quantity of imported crudeoil and patroleum products, as well as suffer contented API gravity. All licensed importance and importance for early are products, as well considered for the Regulator of the Regu

#### Universe

The monthly submission of Form ERA-980 and P-133-M-O is required by all licensed importers and importers and present properties of the present properties of the present properties of the present properties of the submission of the present properties of the present properties of the present properties of the present properties of the ERA present present properties of the ERA present properties

#### Collection Methods

The survey data are collected by mail each month. It is mandatory for each respondent to file the ERA-60/P-133-M-O by the 18th working day of the month following the reporting period. Resubmissions are received frequently and are processed when received:

#### Response Rates

In December 1989, the survey had a response rate of 89 percent by the filling deadline. The universe was 56 at that time, (Because this is a dynamic survey), the universe is constantly changing.) Standard following of nonexpondents is made in tracer that all reports are received, direct data are not imputed following of nonexpondents is made in tracer that all reports are received, direct data are not imputed for more appointed. Response rate is generally 8-89% by the time the data are not imputed for response to the second survey of the second survey of the second survey of the second survey of publications are not generated as attandard operating procedure. The ERA-60 file is never closed; resubmissions are constantly received and processed.

# Note 1.6 Census Import (IM-145) and Export (EM-522 and EM-594) Tabulations

The foreign tradestatistics program, conducted by the Bureau of the Census, involves compilation and dissemination of a large body of data relating to the imports and exports of the United States.

## Import Statistics

## Coverage

The import statistics reflect both government and neagovernment imports of merchandise from foreign countries into the U.S. Customs territory (includes the 50 States, the District of Columbia, and Poerto Rico), without regard to whether or not a commercial transaction is involved. In general, the statistics record the physical movement of merchandise into the United States from foreign countries, with the execution of the following trops of transactions that are excluded from the statistics.

- Merchandise shipped in transit through the United States, when documented with Customs as an intransit movement.
  - Shipments between the United States and Puerto Rico, the Virgin Islands, Guam, American Samos, and other U.S. possessions, shipments between any of these outlying areas; and imports into U.S. possessions from foreign countries.
  - 3. U.S. merchandise returned by U.S. Armed Forces for their own use.

# Source of Import Information The official U.S. import statistic

The official U.S. import statistics are compiled by the Bureau of the Census from copies of the import entry and warehouse withdrawal forms that importers are required by law to file with Customs officials (Customs Forms 7801–7805).

Imported petroleum is reported as "Imports for Consumption," Imports for consumption are a combination of entries for immediate consumption and withdrawals from warehouses for consumption. With certain exceptions as indicated above, these data generally reflect the total of commodities entered into U.S. consumption channels.

#### Country and Area of Orlgin

The country reported in the statistics as the country of origin is defined as the country where the merchandiss was grown, mined, or manufactured. In instances where the country of origin cannot be determined, the transactions are credited to the country of shipmen.

#### Export Statistics

#### Coverage

The expert statistics reflect both government and nongovernment exports of domestic and foreign merchandise from the U.S. Customs territory (includes the 50 States, the District of Columbia, and Puerto Rico) to foreign countries, without regard to whether or not the exportation involves a commercial transaction. In general, the statistics record the physical movement of merchandise out of the United States to foreign countries, with the execution of the following trues of transactions:

- Shipments between the United States and Puerto Rico, the Virgin Islands, Guam, American Samos, and other U.S. possessions; between any of these outlying areas; and shipments from U.S. Possessions to foreign countries.
- 2. Merchandise shipped in transit through the United States from one foreign country to another, when documented as such with U.S. Customs.
- 3. Bunker fuels and other supplies and equipment for use on departing vessels, planes, or other carriers engaged in foreign trade.

#### Source of Export Information

The official U.S. expert statistics are compiled by the Bureau of the Census primarily from copies of Shipper's Export Declarations. Shipper's Export Declarations are required to be filed with Oustoms officials, except when qualified such orders have been suttlered to submit data in the form of magnetic tape, punched cards, or monthly Shipper's Summary Export Declarations directly to the Bureau of the Census.

#### Country and Area of Destination

The country of destination is defined as the country of ultimate destination or the country where the goods are to be consumed, further processed, or manufactures, as known to the shipper at the time of exportation. If the shipper does not how the country of ultimate destination, the shipment is tracedited to the last country to which the shipper knows that the merchandise will be shipped in the same form as it was when exportant.

## Note 2 Estimation

The geographic coverage of all estimates is the 50 United States and the District of Columbia, including adjacent areas of the outer continental shelf, excluding the Hawaiian Foreign Trado Zone.

## Note 2.1 Supply

The components of petroloum supply are field production, refinery production, imports, stock withdrawal or addition, crude all used directly, and losses.

Field Production is the sum of crude oil (including lease condensate) production, natural gas processing plant production, and new supply (field production) of other liquids used by refineries.

Crude oil production is estimated based on data received from State conservation and revenue agencies. Reports of crude oil production from each of the 31 producing States are not received until several months after the other components of petroleum supply described in Explanatory Note 21 are available for publication. For an explanation of the crude oil estimation procedure used until the State renorts are complete, see Evaluatory Note 21.

Field production of natural gas plant liquida (NGPL), including finished petroleum products, is reported monthly on survey Form EIA-64. "Natural Gas Liquida Operation Report." Negative production will occur when the amount of a product produced during the month is less than its amount of that same product that is reprocessed (input) or reclassified to become another product during the same month. For survey description and other detail, see Explanatory Note 1.1.

Field production of natural gas plant liquids (NGPL), including finished petroleum products, reported monthly on survey Form EIA-64, "Natural Gas Liquido Operations Report." Negative production will occur when the amount of a product produced during the month is less than the amount of that same product that is reprocessed (input) or reclassified to become another product during the same month. For survey description and other detail, see Explanatory Note 1.1.

Refinery Preduction of LEGs, ethans, and finished petroleum products is reported monthly or acrey Form Elds. 77, Refinery Report. Published production of these products equals refinery production minus refinery input. Refinery production of unfinished sits and of motor and aviating against behading components appears on an thesis under refinery input. Negative production will occur when the amount of a product produced during the month is less than the amount of that same product that is represented (input) or reliastified to become another product during the same

Refinery production is also reported weekly on survey Form EIA-161, "Refinery Report." Son Explanatory Notes 12 and 13 for survey descriptions and other detail, It should also be noted that refineries do not report production of crude oil, natural gasoline, isopentane, unfractionated stream, plant condensate, or other indirectrions and alcohol.

Imports of crude oil and petroleum products are reported monthly on Form ERA-60, "Report of Oil Imports into the United States and Puerto Rico," and Form P-183-M-O, "Shipments of Refined Products (including unfinished oils) from Puerto Rico to the United States." In addition, the Cansus Bureau Tabulation 1M-145 summarizes import data from Customs import declarations reported on Customs Forms 7501 and 7505. The most prominent difference between the EIA and Census systems appears in imports of liquefied petroleum gases (LPG), where Census data show a much higher level of imports than Energy Information Administration data. This occurs because the ERA-60 respondent frame was built by monitoring importers of licensed products and because LPGs are not licensed products. Therefore, respondents that only import LPGs have not been identified, and do not report these imports to the Department of Energy. Since these importers are required to file form 7501 with the U.S. Customs Service. BIA obtains data on imports of LPGs from Census Tabulation IM-145. Additional data taken from the IM-145 are relatively small quantities of naphtha and kerosene-type jet fuels, distillate fuel oils, and residual fuel oils withdrawn from bonded storage for use in international trade and for military offshore use. Even though these duty-free fuels are stored on United States shores, they did not enter the United States for domestic consumption and therefore are not included in the ERA-80 reporting system.

Imports are also reported weekly on survey Form EIA-165, "Imports Report." See Explanatory Notes 1.3, 1.5, and 1.6 for survey descriptions and other detail.

Stock Withdrawal () or a dolltion () in adealated by subtracting stocks at the end of the most hom stocks at the degrading of the most, fower: The laging insoles does month as requise to the ending at scoke of the most are requise to the ending at scoke of the most are requised to the ending at scoke of the previous month.) A positive result () would represent a withdrawal from attacks and an increase in protections uppelled infertive toeff demander consumption. A negative result () would represent a building of stocks and reduce petroleum supplied distributed for demantic consumption. A negative result () or consumption. Per army forms used to make stock withdrawal or addition additional scale consumption. The army forms used to make stock withdrawal or addition additional scale and the scale of the

Unaccounted-for Crude Oil is a balancing item that represents the difference between crude oil supply and disposition. Crude oil supply is the sum of field production, imports and stock withdrawal or addition, less crude used directly and losses. Crude oil disposition is the sum of exports and refinery input.

Unaccounted-for crude oil is actualistic by submerting crude all supplies from crude oil dispatition. An angular versult indicates that referres and experters a spectra due of more crude oil than was reported to have been available to them. (This occurs, for example, when imports are undercounted due to late reported to have been supplied to refine and an approximation of their problems.) ## Note 2.2: Domestic Crude Oil Production

Data for the Grude Oil Production System (COPS) are reported to the Department of Energy by each of the Individual Share conservation agencies, which collect ortegel orgation studies for the properties in the U.S. Geological Survey reports the volume of crude oil that is produced offshore in addition, the U.S. Geological Survey reports the volume of crude oil that is produced offshore in received monthly. After each calendar year, these monthly numbers are updated using the annual proport from the State concernation agencies, all of these three the propert are received monthly. After each calendar year, these monthly numbers are updated using the annual proport from the State concernation agencies and the U.S. Geological Survey. The six States that do not report monthly values are Indians, New Tork, Cliffs, Foundwinsia, West Tyrgink, and Tyrgink Constitution of the Constitu

There is a time lag of approximately 3 to 4 months between the mid of the reporting month and the time when the actual values are available for this publication, to order to provide more timely considered production astimates, the Department of Energy has established series of statistical models that forecast the volume of crude oil production based on the historical production patterns. The models are Auto Ragressive Integrated Moving Average (ARIMA) to analyse series of monthly crude oil production values collected over severely.

In order to provide detailed cross of large states in formations both the PAD District levels and for the major producing State, the total United States cross oil productions without my state of the state of the produced evaluate was repeated into nine distinct prospings. The nine different time series are the monthly reported cross oil production of the states in PAD District of an extent in PAD District (9 of Passas (6) Dissas (8) Passas separate ARIMA model is identified for each time series. New model parameters are estimated monthly for each of these nine updated time series. Then, these ARIMA models are used to forceast crude oil production volumes for the month of interest. These values are them aggregated into PAD District and national totals. The forceasts made during 1981 had an average error of less than 0.5 excreen commande to the monthly requed by productive volumes eventually reported by the fastes.

## Note 2.3 Disposition

The components of petroleum disposition are refinery input, exports, and products supplied for domestic consumption.

Refinery. Inputs of crude oll, NGPL and other liquids are reported monthly on survey Form EIR-83. "Refiners Report." Polithical inputs of unfinished oils, and motor and valido gasables blending companents, equal refinery input minus refinery output. Refinery inputs of finished pervious proceducts are reported on an exhaust under refinery production. Refinery inputs and exreported weakly on survey Form EIA-161, "Refinery Report." See Explanatory Notes 1.2 and 1.3 for survey describing and other details.

Exports of crude oil and petroleum products are compiled from Census Bureau tabulations EM622 and EM694. Exports include crude oil shipments to Puerto Rico, the Virgin Islanda, and the Hawaiian Foreign Trade Zone, which are obtained from refinery receipts reported on Form EIA-87.

Product supplied for each product is calculated by summing field production plus refinary production, plus imports, plus stock withdrawad or minus such addition, plus crude cill used directly and losses (blus net receipts when calculated on a PAD District basis), minus refinary point, minus appears. This fermula sensore that total dispution equals total supply. Products of the product of the p

# Note 2.5 Average Stock Levels

The grants displaying monthly stock-levels of state-unions products, crude oil, motor gasoline, distillate field, radicular field ill, furtified perioden gains and others, and other products provide the cure with recent data as well as a normany of data from any crude care of year period from January through the critical as well as a normany of data from the contract of the contr

These curves are updated every 6 months effective January 1 or July 1 by basing the "average ranges" on a more recent time period. At that time, each 3-year data series will be adjusted by dropping the first 6 months and including the most recent 6 months.

For each data series, the monthly sessonal factors were estimated by means of a sessonal adjustment technique developed at the Bureau of Census (Census X-11). The seasonal factors were assumed to be stable (i.e., unchanging from year to year) and additive (i.e., the sgries is despasanalized by subtracting the seasonal factor for the appropriate month from the reported stock levels). The intent of deseasonalization is to remove only sessonal variation from the data. Thus, a deseasonalized series deseasonalization is to remove only seasonal variation and in the same translation of the same translation and irregularities as the original data. For crude oil stocks, the derived seasonal factors were very small relative to crude oil stock levels. Therefore, the sessonal factors for erude oil stack levels were set to zero. The seasonal factors for total pstroleum (erude and products) distillate fuel oil, residual fuel oil, liquefied petroleum gases and ethans, and other products were derived using monthly data from 1974-1980. For motor gasoling, the seasonal factors were based on monthly data from 1975, 1976, 1978, 1979 and 1980. In 1977, there was virtually no seasonal behavior in motor esseling stocks. Monthly stock levels stayed at the same high level for the certire year. In addition the sessonal patterns in 1973 and 1974 appeared to be different from those in recent years. It was therefore assumed that the sessonal patterns in 1978, 1974, and 1977 were not representative of the recent past, and these years were not used in the determination of seasonal natterns for motor resolling stocks. Recause of these differences in the year-to-year seasonal fluctuation of motor gasoline, the evidence for the illustrated seasonal patterns for total petroleum (crude and products), crude oil. distillate fuel oil, residual fuel oil, liquefied petroleum gases and ethane, and other products is stronger than is the evidence for the illustrated seasonal patterns for motor exerting

In some cases, these seasonal patterns do not show a smooth transition from month to month. For example, the June factor for residual fuel oil is slightly less than the May and July values, making a bump in the curve. As there is little difference in the magnitude of these seasonal factors, it is possible that this variation is due to the small number of observations (7 years) and the data variability.

After seasonal factors are derived, the most recent 3 year period (from January through December or from July through June) is deseasonalized. The average of the deseasonalized 86-month selderniment her midpoint of the deaseasonalized ware band. The standard error of the deseasonalized 88 months is calculated adjusting for extreme data points. The width of the "average range" is twice this standard error.

The upper curve of the "average range" is defined as the average plus the seasonal factors plus the standard error. The lower curve is defined as the average plus the seasonal factors minus the standard error.

# Note 2.6 Movements

Movements of crude oil between PAD Districts are reported on Form EIA-170. "Tanker and Barge Report." Personner product movements are reported on Forms EIA-170 and EIA-99. "Pipaline Report." Personner product movements are reported on Forms EIA-170 and EIA-99. "Pipaline Products Rappert." Net receipts are calculated by summing total movements into and total movements from each PAD District by pipaline, tankers, and barges, and subtracting for the difference. Movements of crude oil by pipaline are not reported. For survey descriptions and other datall, see Explanatory Notes 12 and 14.

# Note 2.7 Preliminary Monthly Statistics

Data from the Weekly Petroleum Reporting System (Forms EIA-161, 162, 168, 164 and 166) are used to estimate the most recent monthly values for the historical statistics. Since some of the weekly reporting periode overlap 2 adjacent months, it is necessary to use weighting factors in the calculation of the monthly values.

To calculate monthly estimates of crude oil and petroleum product imports, crude oil input to refiner is, and production of petroleum products for a specific month, the weekly estimates are weighted by the number of days of that month included in each week, then sammed.

Bode-mouth stock levels of crude oil and the major protects (motor gasoline, distillate feel and recitable feel) are calculated in a similar manner, but use only the two workey reporting periods that cover the end-of-work stocks before and after the end of the month. The end-of-month stock level is exclusively free acclaiment by first end-of-month stock level is exclusively free acclaiment of the end-of-month stock level is exclusively for exclusively first end-of-month stock level in the end-of-month stock level in the end-of-month stock level. This morbine in untilitied by the weighting fortex of earlier of the weight (the weight in the cover of the institute) of the month of instruct, This change is added to the earlier of the two ond-of-work stock levels to estimate the end-of-month stock level.

Preliminary monthly estimates of domestic crude oil production are calculated as described in Explanatory Note 2.2.

# Note 3 Accuracy of Petroleum Supply Data

Early in 1981, the Energy Information Administration completed an assessment of the accuracy of principal petroleum supply data series. This assessment concentrated on two methods of analysis:

 Comparisons between EIA's final annual estimates published in the Petroleum Statement Annual (PSA) and annual estimates from independent sources.

Comparisons between E1A's final monthly estimates published in the PSA and E1A's earlier estimates
published in the Monthly Petroleum Statistics Report and the Petroleum Statement, Monthly (predecessor
of the Monthly Petroleum Statement).

Selected excerpts from these comparisons are presented below.

#### Comparisons of Annual Estimates

All of the systems that provide data for the Phriosam Supply Monthly, except for the wealty systems, typ collected fast from the entire universe of their potential respondents. They do not sensingly and have no sampling errors. Inscruracies in the data still occur because of problems such as incompleted listed or propedings, recross in the exposess, and occupated errors in the design of the data systems. Such inscruracies are hard to identify and even harder to quentify. Some undestanding of the several data, as shown in the following tables. Once generated the such as designed to the control of the several data, as shown in the following tables. Once agreements among anoust estimates from several independent sources support the conclusion that the estimates are accurate, and accuracy in the anoual estimates.

#### Crude Oil Production

 $\label{lem:comparisons} among independent estimates of annual crude oil and lease condensate production lead to the conclusion that the PSA estimates are probably accurate to within 1 percent.$ 

## Crude Oll Imports

Comparisons among independent estimates of annual crude oil imports lead to the conclusion that the PSA estimates are probably accurate to within 1 percent. This conclusion is supported by a study of BIA and Customa/Census import data performed for BIA:

# Motor Gasoline Supplied

Comparisons among independent estimates of the annual volume of motor guasiline supplied for domestic use show that differences in the estimates grew between 1977 and 1978. By 1979, by 1978, blue for domestic use show that differences in the estimates of procession appears estimate of production had estimate of sales by refiners and the Environmental Protection Apency's estimate of production had grown about 6–7 precent larger than the comparable [58]. Landbarg, and American Petroleum Institute (API) settimates. Research conducted by EIA in 1979 and 1980'e confirmed that the lower

February 1899). Prepared for the Office of Energy Information Validation, Energy Information Administration, U.S. Department of Energy, Weshington, D.C. Office of Energy Information Administration, U.S. Department of Energy, Ass. Published Section Section Supply Sections (Weshington, D.C.: April 1894).

estimates were inaccurate, and identified changes in the petroleum industry that had an adverse effect on the PSA estimate. During 1980, E1A developed and tested improved procedures for collecting petroleum supply data, and implemented them in January 1981, 1980 Explanatory, Note 4.)

#### Distillate Fuel Oil Supplied

Comparisons among independent estimates of the annual volume of distillate fuel oil supplied for domestic use lead to the conclusion that the PSA estimates are probably accurate to within 1 to 2 percent.

### Residual Fuel Oil Supplied

Comparisons among independent estimates of the annual volume of residual field oil supplied for domestic use seem to show sizable and consistent differences between the IBA estimates of sale for prefigers and the PSA and API estimates. When imports of residual field oil by non-refiners are added to the refiner sales, however, the differences between refiner sales and the PSA estimates are near-root to within 1 percent. The comparisons therefore lead to the conclusion that the PSA estimates are probably accurate to within 1 to 2 percent.

# Note 4 Changes in Petroleum Industry Reporting

Petroleum statistics contained in this report for all years through 1980 were developed using definitions, concepts, reporting procedures and aggregation methods that are consistent with backed developed by the Darray Information Administration in 1979 and 1980 indicated that changes had occurred in the petroleum industry that were not being adequately reflected in ELA's reporting systems.

ElA reporting forms definitions, and procedures were modified beginning in January 1981 to describe industry operation more accurately. Unfortunately, empirical information is not available to precisely measure the data shortcomings throughout 1980. However, estimates of the magnitudes of differences in the major data series are described below to form a basis for comparing 1979, 1980, and 1981 data.

#### Motor Gasoline

Prior to 1979, the EIA product-supplied series for motor gasoline was consistently about 2 porcent lower than the Peoleral Highway Administration (PHEM) againtle-sale data series, which is derived from State star receipts. This difference increased to about 4 percent in 1970 and 6 percent in 1980. There are two primary causes for this growing difference. Piers, enfinery operations, percelularly the flower of unfinished oils and the redesignation of come finished products, were not being accountably described on Maria Rai survey forms. Second, a large amount of gasoline was being produced way from reflerated as RAI survey forms. Second, a large amount of gasoline was being produced way from reflerated as the RAI survey forms. Second, a large amount of gasoline was producting according to the second of the second second of the second second second of the second second second of the second second of the second secon

Quantitative estimates of the magnitude of the difference—in ELA's gandline product supplied data; in 1979 and 1989 have been maded by the ELA mode and the American Februlen multitude (AFI). The following table provides 1979 and 1880 data as published in the Februlena Statement, Asson, i.e. well as ELA and AFI estimates of "read" motor gandline product supplied ELA recast estimates were based upon the application of the control of the action of the Control of the Con

Offficed Spargy Information Validation, Energy Information Administration, U.S. Department of Energy, Error Profile of the Motor Fuel Transition Data used to Excatelat and Monitor State Energousy Conservation Targets (Washington, D.C.; December, 1981).

"FHWA gasoline statistics published in their 1973 Table M P-305, 08-08-09, contain avisation gasoline as well as motor gasoline. Only motor gasoline data are included in published 1980 data. Consequently, the 1979 data shown above were reduced by subtracting envision gasoline product applied quantities as poblished by SIA in the 1979 Polardessan Statement Annual. The 1900 FHWA data published in their 1980 Table MF-350A, August 1981, did not require this adjustment.

#### Distillate and Residual Fuel Oil

Distillates and residual field all refinery production statistics through 1990 were adjusted to account for an inhalance between unfinished all supply and disposition. The reported quantities of refinery inspired of cartifiathed alls typically exceed the available supply of unfinished oils. It has been assumed that this occurs when distillates and residuals the all produced by a refinery in shippoid to another refinery, where it is treated as antilinished oil. This oil is then reprocessed rather than osed craded as addistillate or residual rate oil.

For many years (including 1980), the difference between unfinished oil disposition and supply was subtracted from distillate and residual fuel oil production to adjust for this discrepancy. Two-thirds of the difference was applied to distillate, and one-third to residual fuel oil.

Beginning in January 1811 his adjustment was discontinued because there was not sufficient empirical orderes to support. The follow in such promoted distillation and residual field or inferry productions 1900 as published and residual field or inferry productions in 1900 as published to the same basis as 1881 statistics are now being completed the support of the support of the superior between 1900 and 1918 data erizes Adjusted distillate and redshifts for do if product supplied volumes differ from the unsignosted volumes by the same amounts as the adjusted and unsignated production volumes. Adjusted and Unadjusted Refinery Production, and Unadjusted Product Supplied of Distillate and Residual Fuel Oils, by Month for 1979 and 1980 (Thousand Barrels Per Day)

#### Total Petroleum Products

The imbalance between the supply and disposition of unfinished sits is now reported as part of the recessified product line 90 into the 1.8 Pericain Balance (Pale) in Imbalance between the supply and disposition of geneline bineding components comprise the remainder of the reclassified in Table 1. These imbalances are seperied as angular product supplied in the Ober Lugdial section of the table of Supply and Disposition Statistics (Table 50. Since these changes only involve redistribution of the table of the Comprise Co

1979

## Note 5 Notes on Tables

- 5.1 Crude Oil and Petroleum Products Overview statistics on the referenced line appear in Table 4 of the Detailed Statistics, except where noted.
- Crude Oil and Petroleum Products Stock Withdrawal (\*) or Addition (-), Petroleum Products
   Supplied, Total Imports, Crude Oil Imports, Total Experts, and Crude Oil Experts appear as labeled in Table 4. Total Production and Grude Oil Production appear under Field Production in Table 4.
- Natural Gas Plant Production is the sum of Natural Gas Plant Liquids and Finished Pstroleum Products Field Production in Table 4.
- Petroleum Products Imports is the sum of Natural Gas Plant Liquids and LRGs, Other Liquids, and Finished Petroleum Products Imports in Table 4.
- Petrolsum Products Exports is the sum of Natural Gas Plant Liquids and LRGs, Other Liquids, and Finished Petrolsum Products Exports in Table 4.
  - Total Crude Oil and Petroleum Products Ending Stocks appear in thousands of barrels in Table 2.
- 5.2 Crude Oil Supply and Disposition statistics on the referenced line appear in Table 1 of the Detailed Statistics, excent where noted
- Total Demestic Field Production, Alaskan Field Production, SPR Imports, Other Imports (synonymous with Imports Gross Excl. SPR). SPR and Other Primary Stocks Withdrawal (1) or Addition (-).
- Unaccounted For Crude Oil, Rafinery Inputs, and Exports appear as labeled in Table 1.

  SPR Ending Stocks and Other Frimary Ending Stocks (synonymous with stocks axcluding SPR) appear in thousands of barrels in Table 1.
- · Total Crude Oil Ending Stocks appear in thousands of barrels in Table 2.
- · Total Imports appear in Table 4.
- 5.3 Finished Motor Gasoline Supply and Disposition statistics on the referenced line appear in Table 4 of the Detailed Statistics, except where noted.
- . Total Production is the sum of Field Production and Refinery Production in Table 4.
- Imports, Stock Withdrawal (+) or Addition (-), Exports, and Product Supplied appear as labeled in Table 4.
- Unleaded Percent of Total Product Supplied represents the ratio of finished unleaded motor gasoline product supplied to total finished motor gasoline product supplied, multiplied by 100 and rounded to the nearest entity.
- · Ending Stocks appear in thousands of barrels in Table 2.
- 5.4 Distillate and Residual Fuel Oil Supply and Disposition statistics on the referenced lines appea in Table 4 of the Detailed Statistics, except where noted.
- . Total Production is the sum of Field Production and Refinery Production in Table 4.
- Imports, Stock Witherawal (+) or Addition (-), Crude Used Directly, Exports, and Product Supplied appear as labeled in Table 4.
- . Ending Stocks appear in thousands of barrels in Table 2.
- 5.5 Liqueffed Petroleum Gases and Ethane statistics represent the aggregation of statistics on ethane, propane, butane, butane propane mixtures, ethane-propane mixtures, and isobutane. The statistics on the referenced line appear in Table 4 of the Detailed Statistics, except where noted.

- . Total Production is the sum of Field Production and Refinery Production in Table 4.
- Imports, Stock Withdrawal (+) or Addition (-), Refinery Inputs, Exports, and Product Supplied appear as labeled in Table 4.
- · Ending stocks appear in thousands of barrels in Table 2.
- 5.6 Other Petroleum Products Supply and Disposition statistics represent the aggregation of statistics on natural gasoline, isopentane, unfractionated stream, plant condensets, other liquids, and ill finished petrolum products except finished more gasoline, distillate tool all, and residual fuel oil. The statistics on the referenced line are aggregated from Table 4 of the Detailed Statistics, except where nated.
- . Total Production is the aggregated sum of Field Production and Refinery Production in Table 4.
- Imports, Stock Withdrawal (+) or Addition (-), Refinery Inputs, Exports, and Product Supplied are aggregated from Table 4.
- . Ending stocks are aggregated from ending stocks in thousands of barrels in Table 2.

#### Note 5.7 Table 1 U.S. Patroloum Relence

- Lines (1) through (3) of Table 1: Crude oil (including lease condensate) production for "Alaska,"
  "Lower 48 States," and "Tetal U.S." are calculated by calling the conservation agency in Alaska, for
  Alaskan crude oil production during the menth, estimating crude oil production in the United States
  (see Exclusions Mode 22), and taking the difference to caval production in the lower 48 states.
- . Line (5) of Table 1: SPR imports are reported on Survey Form ERA-60.
- Line (12) of Table 1: "Total Other Sources" aguals crude oil stock withdrawal (+) or addition (-) plus unaccounted for crude oil plus crude used as fuel and losses in Table 2.
- Line (14) of Table 1: Natural gas plant liquids (NGPL) "Production" equals field production of natural
  gas plant liquids (NGPL) plus field production of finished petroleum products in Table 2.
- Line (15) of Table 1: NGPL "Imports" equals the sum of the imports of natural gasoline and isopentane, unfractionated stream, and plant condensate imports in Table 2.
- Lins (16) of Table 1: NGPL "Stock Withdrawal (+) or Addition (-)" is equal to the sum of stock withdrawal (+) or addition (-) of natural gasoline and isopentane, unfractionated stream, and plant condensate in Table 2.
- Line (17) of Table 1 equals the sum of lines (14), (15), and (16) of Table 1.
- Lins (18) of Table 1: unfinished oils and gasoline blending components "Stock Withdrawal (+) or Addition (-)" equals stock withdrawal (+) or addition (-) for other hydrocarbons and alcohol, for unfinished ells, motor gasoline blending components, and evisition gaseline blending components.
- Line (20) of Table 1: "Other Hydrocarbons and Alcohol New Supply" equals the field production of sams in Table 2.
- $\ Line (21) on Table 1: "Refinery Processing Gain" is a balancing item equal to total refinery production minus total refinery input in Table 2.\\$
- Line (22) on Table 1: "Crude Used Directly" equals the sum of crude oil used directly as distillate and residual fuel oils in Table 2.
- . Line (28) of Table 1: "Total Other Liquids" equals the sum of lines (18) through (22) of Table 1.
- Lins (24) of Table 1: "Total Production of Products" equals crude oil input to refineries plus field production of NOPLs and finished perroleum products plus imports of natural gasoline and inopentane, unfractionated stream, and plant condensate; plus stock withdrawal (+) or addition (-) of natural gasoline and loopentane, unfractionated stream, and plant condensate; plus stock withdrawal (+) or

- addition (-) of other hydrocarbons and alcohol, unfinished oils, aviation gazdine blending components, and motor gazdine blending components; plus imports of unfinished oils, aviation gazdine blending components, and motor gazdine blending components; plus field production of other hydrocarbons and alcohol; plus total refinery production; minus total refinery input; plus crude oil used as distillate and residual field bit in Table 2.
- Line (25) of Table 1: "Gross Imports of Refined Products" equals imports of LPG and ethane plus imports of finished petroleum products in Table 2.
- Line (26) of Table 1: "Exports of Refined Products" equals exports of LPG and ethane plus exports of finished petroleum products in Table 2.
  - Line (27) of Table 1: "Net Imports of Refined Products" equals the difference between lines (25) and (26) of Table (1).
- Line (36) of Table 1: "Yea's New Supply of Produces" equals crude on input in effecting plus tools production of NCPL and finished perfection production of NCPL and finished perfection production and the production of the NCPL and finished perfection production and importance of interest passion for addition (-) of natural conformation of the NCPL and the NCPL and the NCPL and NCPL
- Line (29) of Table 1: "Refined Products Stocks Withdrawal (+) or Addition (-) equals the sum of stock withdrawal (+) or addition (-) for LPG and others, and finished petroleum products in Table 2.
- · Line (30) of Table 1: "Total Petroleum Products Supplied for Domestic Use" equals total products
- . Lines (31) through (37) of Table 1 equal the respective products supplied in Table 2.
- Line (38) of Table 1: "Other Products Supplied" equals the sum of natural guacine and isopentane, unfractionated stream, plant condensate, avisition gasoline, naphth a: 400 Dep. For perceivation feedstock uses, other oils >400 Deg. F. for petrochemical feedstock use, special naphthas, lubricants, waxes, coke, asphalt r. road oil still uses, and missellaneous products surplied in Table 2.
- Line (39) of Table 1: "Total Reclassified" is a balancing item equal to the sum of unfinished oils, motor
  gasoline blending components, and aviation gasoline blending components products supplied in Table 2.
- . Line (40) of Table 1: "Total Product Supplied" is equal to total products supplied in Table 2.
- The sum of lines (41) and (42) of Table 1, stocks of "Crude Oil and Lease Condensate (Excluding SPR)" and stocks held by the "Strategic Petroleum Reserve," equals ending stocks of crude eil in Table 2. SPR stocks are reported on Prom EIA-99.
- Line (48) of Table 1, stocks of "Refined Products," equals the sum of LPG and chane and finished petroleum product stocks in Table 2.

\$10.5. GOVERNMENT PRINTING OFFICE: 1982-051-746:3

supplied in Table 2.
